

TWO HAND JOYSTICK - IN THREE DIMENSIONS!

Fly your toy airplane using both your left and right hand thumbs simultaneously as joysticks on the display. For example: the right hand thumb controls banking angle (wing tipping) & climb/ decent, while the left hand thumb controls side rudder and speed. This is actually the same functionality as a three dimensional scroll, (page 10) using more than one finger/thumb - or why not use all ten - when you are skilled enough!

MULTIPLE ENTRY TOUCH
